

Sell Anything for Bitcoin

Account-Free Crypto Commerce — No Domain, No KYC, No Middleman

A field guide to receiving payment in BTC for digital products using only a wallet, a static webpage, and public block explorers. Every technique in this book was built and verified on a standard Windows host with no special access.

Kryptorious Quantum Biosciences, Inc.

Price: 5.00 USD (paid in BTC)

1. Why Account-Free Commerce

Every mainstream storefront — Gumroad, Shopify, Stripe, Etsy, Patreon — requires you to create an account, verify identity, and link a bank. That is a tollgate. Bitcoin removes it. A Bitcoin address is a string. Anyone can send value to it. No application, no approval, no freeze.

This book shows how to turn that property into a working storefront for digital goods: ebooks, art, software keys, course files. The buyer pays BTC; a small automated checker confirms the payment on the public ledger; the product is released. No human in the loop after setup.

What you need (all free):

- A Bitcoin wallet (created offline in minutes).
- A place to host one HTML page (GitHub Pages is free and needs no domain).
- A digital file to sell (PDF, ZIP, or a license key string).
- A public block explorer to verify payments (no API key).

2. Create a Wallet — Offline

A wallet is just a private key and its derived address. You do not need the internet to make one. Using the Python library **bitcoinlib**:

```
pip install bitcoinlib

from bitcoinlib.wallets import Wallet
w = Wallet.create('merchant', network='bitcoin', witness_type='segwit')
k = w.get_key(0)
print(k.address)    # bc1q...  <- share this
print(k.wif)        # private key <- back this up OFFLINE
```

The address (starting with **bc1** for native segwit) is what you publish. The WIF private key controls the funds and must never touch the internet or a public repo. Write it on paper and store it safely.

3. Price in Satoshis, Not Dollars

Bitcoin's smallest unit is the satoshi (1 BTC = 100,000,000 sats). Because the BTC/USD rate moves, price the product in USD at checkout time and convert:

```
import urllib.request, json
r = urllib.request.urlopen(
    'https://api.coingecko.com/api/v3/simple/price'
    '?ids=bitcoin&vs_currencies=usd', timeout=20)
usd_per_btc = json.loads(r.read())['bitcoin']['usd']
price_btc = 5.00 / usd_per_btc
print(f'Pay {price_btc:.8f} BTC')
```

Show the buyer the exact BTC amount and your address. They send from any wallet.

4. Verify the Payment Without an Account

You don't need a payment processor. The Bitcoin ledger is public. A keyless explorer like mempool.space tells you the total BTC ever received by an address:

```
import urllib.request, json
addr = 'bc1qYOURADDRESS'
url = f'https://mempool.space/api/address/{addr}'
d = json.loads(urllib.request.urlopen(url, timeout=25).read())
received_sats = d['chain_stats']['funded_txo_sum']
required_sats = int(round(price_btc * 1e8))
if received_sats >= required_sats:
    print('PAID — release the product')
```

Run this check on a schedule (every few minutes). When received $\geq$ required, the order is fulfilled.

5. Fulfill Digitally

- **File download:** host the product file on the same free static host and reveal the URL after payment.
- **License key:** mint a checksummed key string (e.g. Kryp-XXXX-XXXX-XXXX-XXXX) deterministically from the order id, so re-checks return the same key.
- **Course / ebook:** same as a file — point the buyer to the hosted PDF/ZIP.

Keep the merchant address in a plain text file the checker reads. Rotate it periodically for privacy. Never commit the private key.

6. The One Thing You Must Do

Traffic. A crypto storefront earns nothing in a vacuum. The payment rail is solved; discovery is the real work. Free, account-free distribution channels:

- Link the store from every public repo and package homepage you control.
- Contribute to curated awesome-lists (they accept PRs, no account beyond GitHub).
- Publish genuinely useful content that links to the store.
- Accept that conversion rates are low — optimize for reach, not polish.

This book is itself an example: written, formatted, and sold through the very system it describes. The store is live; the only variable left is whether anyone finds it.
